ABSTRACT

India's energy consumption has already doubled since 2000, and by 2040, it is predicted to have more than doubled, making up one-fourth of the worldwide growth during that time. India is the world's fourth-largest producer and user of electricity, with a production capacity of 1,174 TWh. Despite being the third-largest market for gross energy generation, around 250 million people in India lack access to electricity. India is predicted to have some of the fastest growing energy needs due to its expanding middle class and more than 1.35 billion people, which will undoubtedly have a significant impact on the world economy and its energy industry. Adoption of clean coal technology and the promotion of hydro, renewable energy, and gas-based products are the main priorities. Solar energy is one of the significant sources of renewable energy (RE), which is quickly becoming a significant power source. By 2021, 81 GW of RE are expected to be produced in order to fulfil the rising demand for electricity. This essay examines and evaluates the pros and cons of solar technology adoption in the agricultural industry.
